

Henderson-Hasselbalch Calculations for 100 ml of 500 mM Tris-Cl, pH 9

- *Mathematical Proof* -

$\text{HA} \rightleftharpoons \text{H}^+ + \text{A}^-$	HA = Undissociated Acid	A^- = Conjugate Base of HA	H^+ = Hydrogen Ion
$K_a = [\text{H}^+][\text{A}^-]/[\text{HA}]$	<i>Therefore:</i> $-\log[\text{H}^+] = -\log[K_a] + \log[\text{A}^-] - \log[\text{HA}]$		
$\text{pK}_a = -\log[K_a]$	$\text{pH} = -\log[\text{H}^+]$	$\log[\text{A}^-] - \log[\text{HA}] = \log[\text{A}^-/\text{HA}]$	
Henderson-Hasselbalch Equation: $\text{pH} = \text{pK}_a + \log[\text{A}^-/\text{HA}]$			
Tris-base : MW = 121.14 ; $\text{pK}_a = 8.12$ at 25°C			

Since the desired pH is 9, then $9 = 8.12 + \log[\text{A}^-/\text{HA}]$

Therefore, $\log[\text{A}^-/\text{HA}] = 0.880 \therefore [\text{A}^-/\text{HA}] = 10^{(0.880)} = 7.586$

The concentration of conjugate base $[\text{A}^-]$ is equal to the concentration of base (in this case 500 mM) minus the concentration of H^+ (which is what we are solving for). Similarly, the concentration of the undissociated acid is equal to the concentration of H^+ . Thus, $[\text{A}^-/\text{HA}] = ([\text{Base}] - [\text{Acid}]) / [\text{Acid}] = 7.586$

Multiply both sides of the equation by $[\text{Acid}]$ to get : $[\text{Base}] - [\text{Acid}] = (7.586) * [\text{Acid}]$

Add $[\text{Acid}]$ to both sides of the equation to get : $[\text{Base}] = ((7.586) * [\text{Acid}]) + [\text{Acid}]$

Divide both sides of the equation by $[\text{Acid}]$ to get : $[\text{Base}]/[\text{Acid}] = (7.586) + 1$

Invert the equation and get : $[\text{Acid}] = [\text{Base}] / (7.586 + 1) \therefore [\text{Acid}] = [500 \text{ mM}] / (7.586 + 1)$

$$\mathbf{[\text{Acid}] = 58.24 \text{ mM}}$$

If 12.1 M Hydrochloric Acid is used then $[12.1] / [58.24] = 0.208$ (dilution factor)

Divide the desired volume (100 ml) by the dilution factor to get the required volume of HCl to add:

$$100 \text{ ml} / 0.208 = \mathbf{481 \text{ uL of 12.1 M HCl needed}}$$

To determine the amount of Tris-base needed, multiply the desired volume (100 ml), by the desired concentration (500 mM), by the molecular weight (121.14) :

$$(100 \text{ ml}) \times (0.5 \text{ M}) \times (121.14) = \mathbf{6.057 \text{ g}}$$
